<p>None of documents 1-10 listed in the ISR describe a method for manufacturing a backside-illuminated optical sensor having a step for adhering a supporting substrate so that, in a state where an electrode pad formed on one surface of a semiconductor substrate is exposed, a charge reading part formed also on one side of the semiconductor substrate is covered, and a step for cutting a thinned region of the semiconductor substrate and supporting substrate so that a peripheral region corresponding to the region in which the electrode pad and the like are formed is left intact; nor would this be obvious to a party skilled in the art.</p>
